# A342/A542 Quick Connection Guide (data communication)

#### Evaluation board/kit and development tool important notice

- 1. This evaluation board/kit or development tool is designed for use for engineering evaluation, demonstration, or development purposes only. Do not use it for any other purposes. It is not intended to meet the requirements of design for finished products.
- 2. This evaluation board/kit or development tool is intended for use by an electronics engineer and is not a consumer product. The user should use it properly and in a safe manner. Seiko Epson does not assume any responsibility or liability of any kind of damage and/or fire coursed using it. The user should cease to use it when any abnormal issue occurs even during proper and safe use.
- 3. The parts used in the evaluation board/kit or development tool are subject to change without notice.

#### 

- The content of this document is subject to change without notice. Before purchasing or using Epson products, please contact with sales
  representative of Seiko Epson Corporation ("Epson") for the latest information and be always sure to check the latest information
  published on Epson's official web sites and resources.
- 2. This document may not be copied, reproduced, or used for any other purposes, in whole or in part, without Epson's prior consent.
- 3. Information provided in this document including, but not limited to application circuits, programs and usage, is for reference purpose only. Epson makes no guarantees against any infringements or damages to any third parties' intellectual property rights or any other rights resulting from the information. This document does not grant you any licenses, any intellectual property rights or any other rights with respect to Epson products owned by Epson or any third parties.
- 4. Using Epson products, you shall be responsible for safe design in your products; that is, your hardware, software, and/or systems shall be designed enough to prevent any critical harm or damages to life, health or property, even if any malfunction or failure might be caused by Epson products. In designing your products with Epson products, please be sure to check and comply with the latest information regarding Epson products (including, but not limited to this document, specifications, data sheets, manuals, and Epson's web site). Using technical contents such as product data, graphic and chart, and technical information, including programs, algorithms and application circuit examples under this document, you shall evaluate your products thoroughly both in stand-alone basis and within your overall systems. You shall be solely responsible for deciding whether to adopt/use Epson products with your products.
- Epson has prepared this document carefully to be accurate and dependable, but Epson does not guarantee that the information is always accurate and complete. Epson assumes no responsibility for any damages you incurred due to any misinformation in this document.
- 6. No dismantling, analysis, reverse engineering, modification, alteration, adaptation, reproduction, etc., of Epson products is allowed.
- 7. Epson products have been designed, developed and manufactured to be used in general electronic applications and specifically designated applications ("Anticipated Purpose"). Epson products are NOT intended for any use beyond the Anticipated Purpose that requires particular quality or extremely high reliability in order to refrain from causing any malfunction or failure leading to critical harm to life and health, serious property damage, or severe impact on society, including, but not limited to listed below ("Specific Purpose"). Therefore, you are strongly advised to use Epson products only for the Anticipated Purpose.
  - Should you desire to purchase and use Epson products for Specific Purpose, Epson makes no warranty and disclaims with respect to Epson products, whether express or implied, including without limitation any implied warranty of merchantability or fitness for any Specific Purpose. Please be sure to contact our sales representative in advance, if you desire Epson products for Specific Purpose:
    - Space equipment (artificial satellites, rockets, etc.)/Transportation vehicles and their control equipment (automobiles, aircraft, trains, ships, etc.)/Medical equipment/Relay equipment to be placed on sea floor/ Power station control equipment/Disaster or crime prevention equipment/Traffic control equipment/Financial equipment
    - Other applications requiring similar levels of reliability as the above
- 8. Epson products listed in this document and our associated technologies shall not be used in any equipment or systems that laws and regulations in Japan or any other countries prohibits to manufacture, use or sell. Furthermore, Epson products and our associated technologies shall not be used for the purposes of military weapons development (e.g. mass destruction weapons), military use, or any other military applications. If exporting Epson products or our associated technologies, please be sure to comply with the Foreign Exchange and Foreign Trade Control Act in Japan, Export Administration Regulations in the U.S.A (EAR) and other export-related laws and regulations in Japan and any other countries and to follow their required procedures.
- 9. Epson assumes no responsibility for any damages (whether direct or indirect) caused by or in relation with your non-compliance with the terms and conditions in this document or for any damages (whether direct or indirect) incurred by any third party that you give, transfer or assign Epson products.
- 10. For more details or other concerns about this document, please contact our sales representative.

20220308	2022/3/8	ALL	New release.

#### 1. Introduction

This document is intended to provide users with a quick and easy installation of A342/A542 vibration sensor for data communication control. It explains controls in UART Auto Sampling mode. For other measurement modes (UART burst, SPI burst/normal) and detailed register specifications, please refer to the latest version of the datasheet.

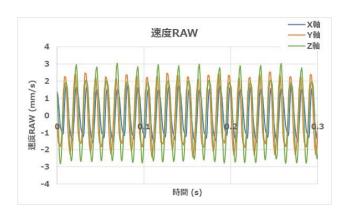

In this document, the measurement under the following conditions (1) and (2) will be explained according to the steps 1 to 6 in Table 1.1.

#### 1) Velocity RAW Sampling at 3000 Sps

- When performing vibration analysis such as frequency analysis or Lissajous analysis.
- To perform RMS calculation required for ISO10816 evaluation on a host device (e.g. PC), etc.
- Figure 1.1 shows an example of the A342/A542 Velocity RAW Output.

#### 2) Velocity RMS Sampling at 1 Sps

- In case of ISO 10816 evaluation with the velocity RMS value calculated by the sensor, etc.
   ※Low sampling rate (0.1 s to 25.5 s) and no requirement for RMS calculation saves processing load on the host device.
- Figure 1.2 shows an example of the A342/A542 Velocity RMS Output.

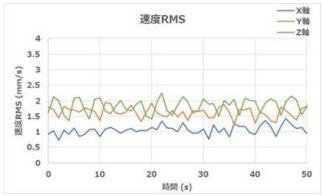

Figure 1.1 A342/A542 Velocity RAW Output

Figure 1.2 A342/A542 Velocity RMS Output

Table 1.1 Description Procedure in This Document

Step	Description
(1) Device Connection	Explanation of the device connection between the sensor and the host device.
(2) Basics of Command Control	Basics of command-based sensor control used in Steps 3 to 5.
(3) Power-On to Start-Up	Explanation of the sequence from power-On / reset to initialization completion.
(4) Configurations	Explanation of the configuration procedure for the output physical quantity.
(5) Data Acquisition	Explanation of the data acquisition procedure when UART Auto sampling is used.
(6) Converting Acquired Data to Physical Quantity Units	Explanation of converting the acquired data to physical quantity units.

#### 2. (Step 1) Device Connection

#### 2.1. Device Connection Configuration

The sensor is connected to the host device (MCU, PC, etc.). Connection configuration examples are shown below.

Refer to the Quick Connection Guide (device connenction) "A542A342\_A552A352\_Quick-Connection-Guide(device connection).pdf" for details.

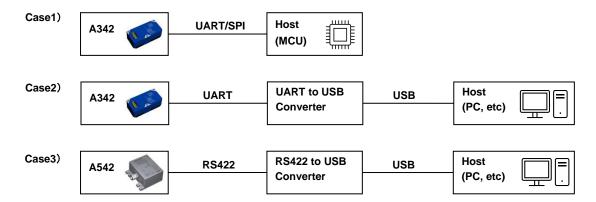

Figure 2.1 Examples of A342/A542 Connection Configuration

#### 2.2. Serial Interface Connection Diagram

Please provide noise countermeasures for the power supply if necessary. The connection diagrams and communication format are shown below.

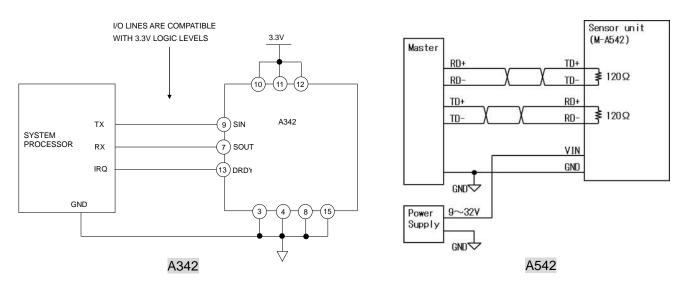

Figure 2.2 Connection Diagrams

Table 2.1 Communication Settings

Parameter	A342 settings
Transfer Rate	460.8 kbps (Factory default)  %115.2 kbps / 230.4 kbps / 921.6 kbps are also available.
Start Bit	1 bit
Data Bits	8 bits
Stop Bit	1 bit
Parity	None
Delimiter	CR (0x0D)

#### 3. (Step 2) Basics of Command Control

The sensor control is conducted by sending a command to access the specific register where the function is assigned. Below is a description of the basics of command-based sensor control.

#### 3.1. Register Read Command (UART)

By sending the register read command to the sensor via UART, the data stored in the register can be read out in 16-bit units. This acquires the various sensor settings and status information stored in the register.

The read command format is as follows: 1st byte is the register address, 2nd byte is unused (no argument specified), and 3rd byte is the delimiter (0x0d). The 1st byte: bit [7] of the read command is fixed to "0". For example, when reading the MODE\_CTRL register at 0x02-0x03, the 1st byte is filled with the lower address 0x02 of the MODE\_CTRL register as it is.

The response format is as follows: 1st byte is the register address, 2nd to 3rd bytes correspond to 16-bit read data, and 4th byte is the delimiter (0x0d).

The register read timing, read command format, and UART register read example are shown below.

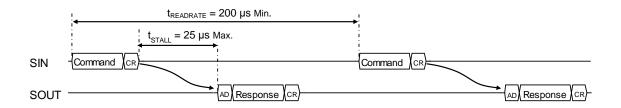

Figure 3.1 UART Read Timing (460.8 kbps)

Table 3.1 Read Command Format

			1st l	byte	)					2	2nd	byte	)		2nd byte							3rd byte							
7	6	5	4	3	2	1	0	7	7 6 5 4 3 2 1 0							7 6 5 4 3 2 1						0							
0	Ι () Ι ΔΙΑ:() Ι										Х								0x	0D									

A [6:0] · · · Register address (even address)

XX ··· Don't Care 0x0D ··· Delimiter

Table 3.2 Read Response Format

		•	1st l	byte	)					2	2nd	byte	)					3	3rd l	byte	)					4	4th I	oyte	)		
7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
0			Α	.[6:0	)]						D[1	5:8]							D[7	':0]							0x0	)D			

A [6:0] ··· Register address (even address)
D [15:8] ··· Register read data (upper byte)
D [7:0] ··· Register read data (lower byte)

0x0D · · · Delimiter

#### Register Read Example (UART)

Read the current operation mode from MODE\_CTRL register.

 $Tx = \{0x02, 0x00, 0x0d\}.$  /\* Read out MODE\_CTRL \*/  $Rx = \{0x02, 0x04, 0x00, 0x0d\}.$  /\* Retrieve the response value \*/

1st byte: 0x02 corresponds to the lower address of MODE\_CTRL.

2nd byte: 0x04 indicates the current operation state being in Configuration mode.

3rd byte: 0x00 is a dummy response. 4th byte: 0x0d corresponds to a delimiter.

#### 3.2. **Register Write Command (UART)**

By sending the register write command to the sensor via UART, the register write data is written in 8-bit units. Various sensor settings and measurement operations can be controlled by this command. No corresponding response for it.

The write command format is as follows: 1st byte is the register address, 2nd byte is the write data, and 3rd byte is the delimiter (0x0d). The 1st byte: bit [7] of the read command is fixed to "1". For example, when writing data to the upper address 0x03 (00000011b) of the MODE\_CTRL register, add "1" to the head of the address then 0x83 (10000011b) becomes the 1st byte.

The register write timing, write command format, and UART register write example are shown below.

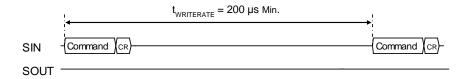

Figure 3.2 UART Write Timing (460.8 kbps)

Table 3.3 Write Command Format

	1st byte								2	2nd	byte	Э					;	3rd	byte	)		
-	7 6 5 4 3 2 1 0 7 6 5 4 3 2 1 0							0	7	6	5	4	3	2	1	0						
	1 A[6:0]							D[7	<b>7</b> :0]							0x	0D					

· · · Register Address (odd or even number) A [6:0]

D [7:0] · · · Register Write Data

0x0D Delimiter

#### Register Write Example (UART)

Write "0x01" to MODE\_CTRL (L) to go to Sampling mode.

/\* Write to MODE\_CTRL (L) to go to Sampling mode \*/  $Tx = \{0x83, 0x01, 0x0d\}.$ 

1st byte: 0x83 is the value obtained by setting bit [7] of the upper address 0x03 of

MODE\_CTRL to 1.

2nd byte: 0x01 executes the transition to Sampling mode.

3rd byte: 0x0d corresponds to a delimiter.

#### 3.3. **Register Specifications**

The following register specifications need to be understood for command-based sensor control. As for specific use cases, refer to the process flows in Step 3 to Step 5.

#### Register Format and Basics of Command Control

- Each register has a 16-bit data length, with an address assigned every 8 bits. Register access is performed in 16-bit units when reading and in 8-bit units when writing. The data in the 16-bit registers is stored in little-endian format.
- The registers are accessed in this device using a WINDOW method. The window number is first written to WINDOW\_ID, then the desired register address can be accessed. The window number of each register is shown in the register map in Table 3.4, but basically grouped as 1) and 2) below.
  - 1) Sensor settings are made in Configuration mode with **WINDOW\_ID** = 1.
  - 2) Readout of measurement results is made in Sampling mode with WINDOW\_ID = 0.
- Initial values of the registers after startup are the values shown in the "Default" column in Table 3.4.

Table 3.4 shows the register map used in Step3 ~ Step5.

Table 3.4 Register map used in Step3 ~ Step5

Name	Window ID	Address	(*1) Read Command 16-bit Read	Write Command 8-bit Write	R/W	Flash Backup	Default	Function

<sup>\* 1)</sup> Lower byte XX: Do not care

#### 4. (Step 3) Power-On to Start-Up

How to activate the sensor is described below.

When the 3.3V power supply is applied to the sensor, the internal initialization starts as shown in the state transition diagram below.

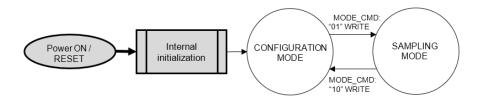

Figure 4.1 State Transition Diagram (Start-Up)

Do not access the sensor during the initialization process (Power-On Start-Up Time = 800 ms Max.). The results of the hardware check at startup can be read by DIAG\_STAT1 register. After the internal initialization is complete, start the sensor control. The startup process flow is shown below.

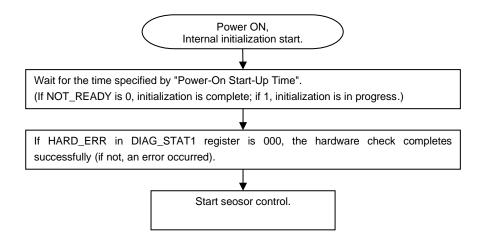

Figure 4.2 Startup Process Flow

#### 5. (Step 4) Configurations

How to configure the sensor is explained below.

As shown in the state transition diagram below (Figure 5.1), the state after initialization automatically shifts to the configuration mode. The sensor configurations can be made in this configuration mode.

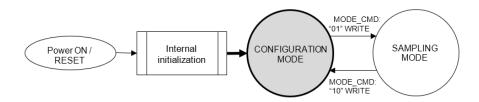

Figure 5.1 State Transition Diagram (Configuration Mode)

The following describes the specific processing steps for making typical sensor configrations shown in Table 5.1.

1) Velocity RAW data (factory default) 2) Velocity RMS data Setting item **UART** baud rate 460.8 kbps 460.8 kbps **UART** output mode Auto mode Auto mode Velocity RMS Velocity RAW Output physical quantity TEMP2 + Velocity-XYZ TEMP2 + Velocity-XYZ Output data format RAW output data rate 3000 Sps (fixed) 3000 Sps (fixed) RMS output data rate / update rate 1 s / 0.6826 s 1 s / 0.6826 s

Table 5.1 Examples of Typical Sensor Configurations

#### 1) 3000 Sps, Velocity RAW data

These configulations are the factory defaults that require no configuration changes. Measurement can start immediately. Go to "(Step 5) Data Acuisition".

#### 2) 1 Sps, Velocity RMS data

How to change from the factory default settings to the velocity RMS settings is described below.

To change settings in principle, first set **WINDOW\_ID** in the WIN\_CTRL register to "1", then write the setting value to the register to be changed.

Figure 5.2 shows the configuration process flow for this setting (velocity RMS data). To change the output physical quantity to velocity RMS, set "velocity RMS: 0001" to OUTPUT\_SEL. The output data rate and update rate can also be changed as needed. The procedure for reverting from velocity RMS to velocity RAW is the same as in this flow, except that "velocity RAW: 0000" is set to the OUTPUT\_SEL.

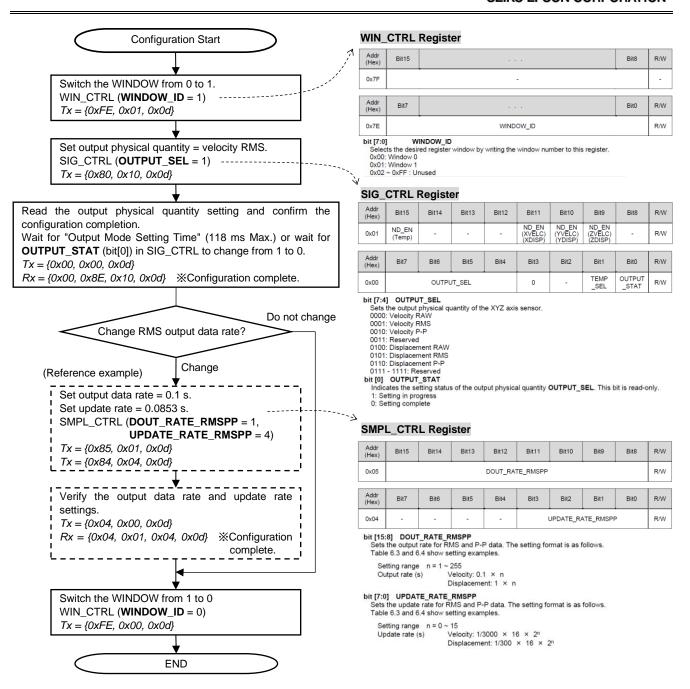

Figure 5.2 Configuration Process Flow (Velocity RMS data)

#### 6. (Step 5) Data Acquisition

How to acquire sensor measurement data is described below.

The state transition diagram in Fugure 6.1 shows that writing "01" to **MODE\_CMD** in the MODE\_CTRL register shifts the state from the configuration mode to the sampling mode and starts measurement. Writing "10" to the **MODE\_CMD** shifts the state from the sampling mode to the configuration mode and terminates the measurement. Writing to the MODE\_CTRL register should be performed with **WINDOW\_ID** = 0.

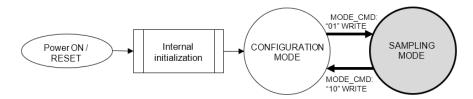

Figure 6.1 State Transition Diagram (Sampling Mode)

Measurement data can be acquired in the sampling mode. The UART Auto sampling mode is set as the factory default setting. As shown in Figure 6.2, measurement data is automatically transmitted at each sampling timing generated by the internal clock.

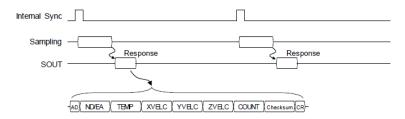

Figure 6.2 UART Auto Sampling Sequence

Table 6.1 Data Packet Format (Factory Default)

BURST\_CTRL [0x0C(W1)] = 0x4700 (Burst Output: TEMP, XYZ) SIG\_CTRL [0x00(W1)] = 0x8E00 (Output Mode: Velocity, TEMP2) Data packet size: 13 bytes

Byte No.	Name	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0				
1	ADDRESS				0x	80							
2	TEMP2_H				TEMP2	2 [15:8]

Figure 6.3 shows the data acquisition process flow for UART auto sampling.

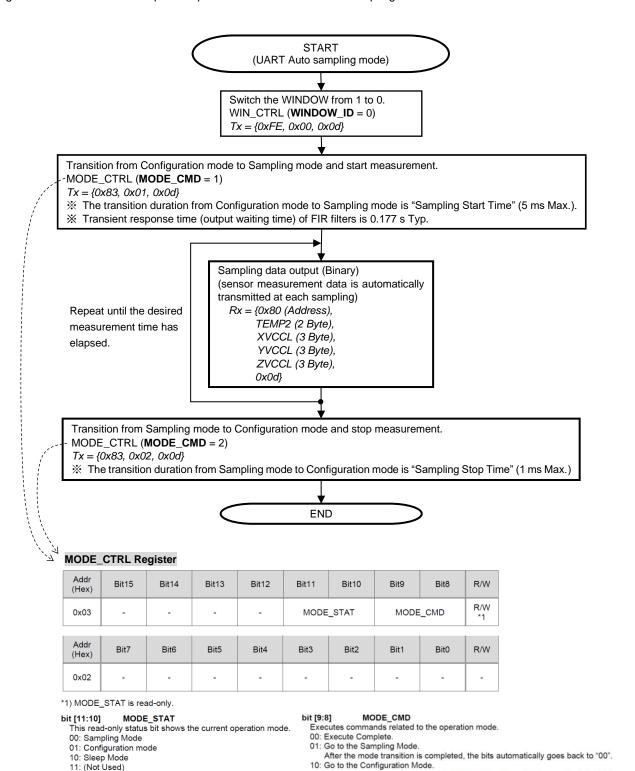

Figure 6.3 Data Acquisition Process Flow for UART Auto Sampling.

11: Go to the Sleep Mode.

After the mode transition is completed, the bits automatically goes back to "00".

After the mode transition is completed, the bits automatically goes back to "00".

### 7. (Step 6) Converting Acquired Data to Physical Quantity Units

Unit conversion procedures for the acquired data (binary data) are described below.

Based on the data acquired in Step 5, the meaning of each data and the calculation formulas to convert the data to physical quantity units are shown below. The calculation formulas are the same for velocity RAW data and velocity RMS. Refer to Figure 7.1 for TEMP2 register and XVELC/YVELC/ZVELC register specifications.

- Acquired data series (hexadecimal): 80 08 02 00 01 99 FF EC B3 00 25 5E 0D
- 1) Address = 0x80
- 2) TEMP2 = 0x0802
  - 2-1) 8BIT TEMP = 0x08Temperature Conversion Fomula: T (°C) = SF  $\times$  a + 34.987

 $= -0.9707008 \times 8 + 34.987 = 27.2213936$ 

SF: Scale Factor = -0.9707008 (°C/LSB) a: Acuired temperature data (decimal)

2-2) Flag information and 2-bit count value = 0x02

Structural resonance warning flags: bit [7:5] = 000: Measurement values are within normal range for all 3 axes. Alarm detection flags: bit [4:2] = 000: No alarms are detected for any of the 3 axes.

\* Detected based on the threshold values stored in the ALARM registers.

2-bit count value: bit [1:0] = 2  $\times$  Incremented at each sampling (ex. 0  $\rightarrow$  1  $\rightarrow$  2  $\rightarrow$  3  $\rightarrow$  0  $\rightarrow$   $\cdots$ ).

#### 3) VELC = 0x000199, 0xFFECB3, 0x00255E

Velocity Conversion Formula:  $(m/s) = a \times SF$ 

SF: Scale Factor =  $2^{-22} = 2.38 \times 10^{-4} (\text{mm/s})/\text{LSB}$ a: Acuired velocity data (decimal)

3-1) XVELC = 0x000199 = 409 X axis velocity =  $409 \times 2^{-22} = 0.098$  (mm/s)

3-2) YVELC = 0xFFECB3 → -4941 

※ Since the number is negative ("sign" bit [23] = 1), 2's complement is used for

Y axis velocity =  $-4941 \times 2^{-22} = -1.178 \text{ (mm/s)}$ 

3-3) ZVELC = 0x00255E = 9566 Z axis velocity =  $9566 \times 2^{-22} = 2.281 \text{ (mm/s)}$ 

#### 4) Delimiter = 0x0D

#### **TEMP2** Register

Addr (Hex)	Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	R/W	
0x2F				8BIT_	TEMP				R	
Addr (Hex)	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	R/W	
0x2E	X2E X_EXI Y_EXI Z_EXI XALARM YALARM ZALARM ZBIT_COUNT _ERR _ERR _ERR _ERR _ERR _ERR _ERR _ER									

lote) EXI\_ERR flags and ALARM\_ERR flags are cleared to "0" by reading this register. These flags have the same tunction as those in the FLAG (ND/EA) register. However, the ND flag states are not linked and needs to be cleared These registers contain the 3-ay.

## bit [15:8] 8BIT\_TEMP Temperature sensor output data (8 bits) The internal temperature sensor value can be read from this regis The output data format is 8-bit two's complement format.

Please refer to the below formula for conversion to temperature in centigrade. Please refer to Table 1.3 Sensor Specification for the scale factor value. There is no guarantee that the value provides the absolute value of the internal temperature.

T<sub>8bit</sub> (°C) = SF<sub>8bit</sub> × a + 34.987

SF: Scale Factor

a: Temperature sensor output data (decimal)

# It | J ALARM ERR This bit indicates when the measured value of X-axis becomes abnormal due to structural resonance in the sensor. Until this bit is read, the upper limit of the measurement range is output as the sensor value instead of the measured value as a warning. 1: Measurement value is abnormal due to structural resonance bit [4] XALARM ERR This bit indicates when the sensor value exceeds the value set in register: X\_ALARM [0x47-0x46(W1)] in the X axis during measurement. 1: detection

Only this bit is lead, the upper limit of the imeasurement range value as a warning.

1: Measurement value is abnormal due to structural resonance

0: Measured value is within normal range

it [6] Y\_EXI\_ERR

This bit indicates when the measured value of Y-axis becomes abnormal due to structural resonance in the sensor. Until this bit is read, the upper limit of the measurement range is output as the sensor value instead of the measured value as a warning.

Measurement value is abnormal due to structural resonance

# .. ... — we see that the second of the seco

value as a warning.

1: Measurement value is abnormal due to structural resonance
0: Measured value is within normal range

#### **VELC** Register
